OsiSense XX

Catalogue

Optimise detection with OsiSense XX

Detect all types of objects in all types of applications with **OsiSense™ XX** ultrasonic sensors. These ultrasonic sensors offer an efficient solution for reliable and high performance detection at distances of up to 8m, this being mainly due to the mode window*.

* The mode window enables suppression of the foreground and the background using the same sensor.

Making sense of sensors SM

> A technology suited to your needs

Ultrasonic sensors enable detection, without contact, of any object in severe industrial environments, irrespective of its:

- material (metal, plastic, wood, cardboard, etc.),
- nature (solid, liquid, powder, paste, etc.),
- colour,
- degree of transparency.

The ultrasonic sensors are simple to install due to their integral connector and availability of cabling and fixing accessories.

100%

of materials detected in all applications

> 3 modes for assuring efficient detection

Diffuse mode

The object reflects the ultrasonic wave back to the sensor which, in turn, changes the output state.

Well suited to flat objects with their surface perpendicular to the ultrasonic beam.

Reflex mode

The sensor is in a permanently detecting state on a fixed background of the machine and when the object to be detected breaks the ultrasonic beam the output changes state. Well suited to objects that absorb the ultrasonic wave (sponges etc.) or which do not reflect the wave back to the receiver (pointed objects or those with non perpendicular faces).

Thru-beam mode

The transmitter permanently transmits the ultrasonic wave to a receiver. The breaking of the ultrasonic beam by the presence of an object changes the output state of the receiver.

Well suited to the detection of small objects, accuracy and high switching frequencies.

> Long distance proximity detection

The use of ultrasonic technology now makes it possible to obtain much longer detection distances. The new OsiSense XXV Ø18 ultrasonic sensors enable detection from 0 to 50 mm (i.e. 2.5 times more than standard products on the market) irrespective of the environment or object material and colour.

x 2,5
detection distance

In cases where detection distances for moving metal parts are very short, there is always a risk of the sensor being damaged on the slightest impact or knock. Increasing the detection distance of the moving metal parts assures safety of the sensor. Machine downtimes linked to incidents are reduced, as well as maintenance costs. You increase the profitability of your installations!

Osisense XXV Ø18

Standard product

The OsiSense XXV ultrasonic sensor is “Plug and Play”, no adjustment required, no teaching. Its solid-state output changes state when the object to be detected is less than 50 mm away.

The fineness and accuracy of its transmission angle enable only the desired object to be detected. Both mutual interference between sensors and edge effects are mastered

Quality, standards and certifications

Quality control

The OsiSense XX ultrasonic sensors are subjected to special precautions in order to guarantee their reliability in the most arduous industrial environments.

■ Qualification

A qualification procedure on the characteristics of OsiSense XX ultrasonic sensors is carried out in our laboratories.

■ Production

The electrical characteristics, sensing distances at the ambient temperature and operating temperatures are 100% verified.

Sensors are statistically selected during the course of production and subjected to **monitoring tests** on all qualified characteristics.

■ Customer returns

Returned ultrasonic sensors are subjected to systematic analysis and corrective actions are implemented to eliminate recurrence of the fault.

Conformity to standards

The OsiSense XX ultrasonic sensors conform to the standards IEC 60947-5-2.
Standards and characteristics: refer to pages 15, 17, 19 and 21.

Resistance to chemicals in the environment

To ensure lasting efficient operation, it is essential that any chemicals coming into contact with the ultrasonic sensors will not affect their casing and, in doing so, prevent their reliable operation.

Due to the materials used, OsiSense XX ultrasonic sensors are very resistant to:

■ chemical agents:

salts, aliphatic and aromatic oils,
petroleum, diluted bases and acids.

Depending on their nature and concentration, tests should be carried out beforehand for the following chemical agents:
alcohols, ketones and phenols.

■ food industry products:

vegetable oils, animal fats,
fruit juices,
milk proteins, etc.

Resistance to the environment

■ IP 65: protection against water jets.

Tested in accordance with IEC 60529: the device is subjected to water sprayed from a Ø 6.3 mm nozzle, at a flow rate of 12.5 litres/min for 3 min at a distance of 3 m.
No deterioration in either operating or insulation characteristics is permitted.

■ IP 67: protection against the effects of immersion.

Tested in accordance with IEC 60529: the sensor is immersed for 30 minutes in 1 m of water.
No deterioration in either operating or insulation characteristics is permitted.

Recommendations

The ultrasonic sensors are designed for use in standard industrial applications involving presence detection. Since these sensors do not incorporate a redundant electrical circuit, they are not suitable for use in safety applications. For safety applications, please refer to our "Safety functions and solutions using Preventa" catalogue.

Principle of ultrasonic detection

Presentation

Ultrasonic sensors enable detection, without contact, of any object irrespective of its:

- material (metal, plastic, wood, cardboard, etc.),
- nature (solid, liquid, powder, etc.),
- colour,
- degree of transparency.

They are used in industrial applications for detecting, for example:

- the position of machine parts,
- the presence of the windscreen during automobile assembly,
- the flow of objects on a conveyor system: glass bottles, cardboard packages, cakes, etc.,
- the level
- of different colour paints in pots,
- of plastic pellets in injection moulding machine feeders.

The ultrasonic sensors are simple to install due to their integral connector and availability of cabling and fixing accessories.

Operating principle

The principle of ultrasonic detection is based on measuring the time taken between transmission of an ultrasonic wave (pressure wave) and reception of its echo (return of transmitted wave).

OsiSense XX ultrasonic sensors comprise:

- 1 a high voltage generator
- 2 a piezoelectric transducer (transmitter and receiver)
- 3 a signal processing stage
- 4 an output stage

Excited by the high voltage generator 1, the transducer (transmitter-receiver) 2 generates a pulsed ultrasonic wave (200 to 500 kHz depending on the product) which travels through the ambient air at the speed of sound. When the wave strikes an object, it reflects (echo) and travels back towards the transducer. A micro controller 3 analyses the signal received and measures the time interval between the transmitted signal and the echo. By comparison with the preset or taught times, it determines and controls the output states 4. The output stage 4 controls a solid-state switch (PNP or NPN transistor) corresponding to a NO or NC contact (detection of object).

Advantages of ultrasonic detection

- No physical contact with the object to be detected, therefore, no wear and detection possible of fragile and/or freshly painted objects, etc.
- Detection of any material, irrespective of colour, at the same distance, without adjustment or correction factor.
- Teach mode function, by simply pressing a button, for defining the effective detection zone. Teaching of the minimum and maximum sensing distances (very precise foreground and background suppression, ± 6 mm).
- Very good resistance to industrial environments (robust products entirely encapsulated in resin).
- Solid-state units: no moving parts in the sensor, therefore, service life independent of the number of operating cycles.
- Various types of outputs to suit requirements:
 - Digital output for level control or detection of any type of object
 - Analogue output for controlling systems that require a signal that is proportional to the distance at which the object is detected.

Terminology

PR = drop-out point
PE = pick-up point

Definitions

The terms listed below are defined by the standard IEC 60947-5-2:

- **Nominal sensing distance (Sn)**
Conventional value for indicating the sensing distance. It does not take into account manufacturing tolerances nor variations caused by external conditions such as voltage and temperature.
- **Detection zone (Sd)**
Zone in which the sensor is sensitive to objects.
- **Minimum sensing distance**
Lower limit of the specified detection zone.
- **Maximum sensing distance**
Upper limit of the specified detection zone.
- **Assured operating distance (Sa)**
This corresponds to the operating zone of the sensor (activation of outputs), and is included in the detection zone. It is also known as the "detection window".
Its limits are fixed:
- at the factory for fixed sensing distance sensors,
- when setting-up within the application for sensors with teach mode.
- **Blind zone**
Zone between the sensing face of the sensor and the minimum sensing distance in which no object can be reliably detected.
Avoid any passing of objects in this blind zone during operation of the sensor. This could lead to instability of the output states.
- **Differential travel**
The differential travel (H) or hysteresis is the distance between the pick-up point as the standard metal target moves towards the sensor and the drop-out point as it moves away from the sensor.
- **Repeat accuracy**
The repeat accuracy (R) is the precision of reproduction between two successive measurements of the sensing distance, made in identical conditions.
- **Overall beam angle**
Fixed angle around the reference axis of an ultrasonic proximity sensor.
- **Standard metal target**
The standard IEC 60947-5-2 defines the standard target as a square metal plate, 1 mm thick with rolled finish, placed perpendicularly to the reference axis.
Its side dimension depends on the detection zone:

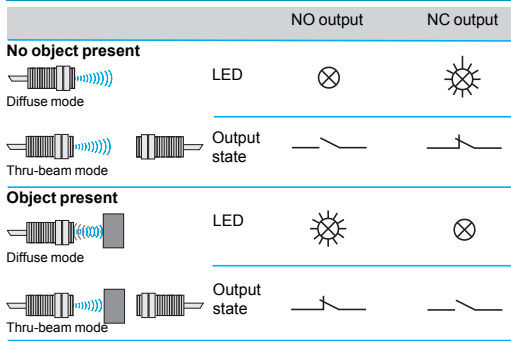

Detection zone (mm)	Size of target (mm)
< 300	10 x 10
300 < d < 800	20 x 20
> 800	100 x 100

- **Voltage drop (Ud)**
The voltage drop (Ud) corresponds to the voltage at the terminals of the sensor when in the closed state (value measured at the nominal current of the sensor).

- **First-up delay**
Time required to ensure operation of the sensor's output signal following power-up.
1 Power-up
2 Output signal state (0 or 1)

- **Response time**
Response time (Ra): time taken between the instant the object to be detected enters the active zone and the changing of the output signal state. This time limits the passing speed of the target in relation to its dimensions.
Recovery time (Rr): time taken between the object being detected leaving the active zone and the changing of the output signal state. This time limits the interval between 2 objects.

Digital outputs

LED indicators

The majority of OsiSense XX ultrasonic sensors incorporate light-emitting diode output state indicators.

- Ø 12 sensor
 - Green LED (power on)
 - Yellow LED (object present)
- Ø 18 sensor, sensitivity 500 mm (except "thru-beam" versions XXT 18 and XXR 18)
 - Yellow (object present) LED or green (power on) LED + user assistance when adjusting the detection zone
- Ø 30 sensor
 - Multicolour LED for assisting the user when adjusting the detection zone
 - Yellow LED (object present)
 - Analogue version with LED (object present, with luminosity increasing as output signal increases)
- Parallelepiped format sensor
 - XX●F: Dual colour yellow (object present) or green (power on) LED
 - XX●V: Dual colour yellow (object present) or green (power on) LED + user assistance when adjusting the detection zone
 - XX7 K: Yellow (object present) LED; green (power on) LED
 - XXT K, XXR K: Yellow (object present) LED
 - XX●D: Yellow (object present) LED; green (power on) LED
 - Analogue version with LED (object present, with luminosity increasing as output signal increases).

Sensors with digital switching

Output contact logic

- NO contact (normally open)

Corresponds to a sensor whose output changes to the closed state when an object is present in the detection window.
- NC contact (normally closed)

Corresponds to a sensor whose output changes to the open state when an object is present in the detection window.

4-wire technique

NO output/PNP and NPN

NO + NC output/NPN

NO + NC output/PNP

These sensors comprise 2 wires for the supply and 1 wire for each output signal

3-wire technique

NO output/NPN

NO output/PNP

These sensors comprise 2 wires for the supply and 1 wire for the output signal,

- PNP type:** switching the positive side to the load.
- NPN type:** switching the negative side to the load

Sensors with analogue output

Operation

The characteristic feature of these sensors is the output which delivers a signal (either current or voltage) that is proportional to the distance of the object being detected. Within the detection limits, which are adjustable using teach mode, the value of the output signal increases or decreases in relation to the distance of the object. When an object is detected, an LED indicator (D) illuminates and its luminosity increases in relation to the value of the output signal. The slope of the signal can simply be changed by pressing the teach button

Advantages

- Visual information available relating to the sensor/object distance.
- Protection against reverse polarity.
- Protection against overloads and short-circuits.
- No residual current, low voltage drop.

Power supply

Sensors for DC circuits

- **DC source:** Check that the voltage limits of the sensor and the acceptable level of ripple, are compatible with the supply used.
- **AC source** (comprising transformer, rectifier, smoothing capacitor): The supply voltage must be within the operating limits specified for the sensor.

Where the voltage is derived from a single phase AC supply, the voltage must be rectified and smoothed to ensure that:

- the peak voltage of the DC supply is lower than the maximum voltage rating of the sensor.

Peak voltage = nominal voltage $\times \sqrt{2}$

- the minimum voltage of the DC supply is greater than the minimum voltage rating of the sensor, given that:

$$\Delta V = (I \times t) / C$$

ΔV = maximum ripple: 10% (V),

I = anticipated load current (mA),

t = period of 1 cycle (10 ms full-wave rectified for a 50 Hz supply frequency),

C = capacitance (μ F).

As a general rule, use a transformer with a lower secondary voltage (U_e) than the required DC voltage (U).

Example:

18 V \sim to obtain 24 V \dots ,

36 V \sim to obtain 48 V \dots .

Setting-up precautions

For diffuse sensors:

Mounting side by side
 $e \geq 0.3$ at 3 m

Mounting face to face
 $e \geq 4 S_n$ max.

XSZ B100

Mounting

Mounting distance between ultrasonic sensors

If 2 standard sensors are mounted too close to each other, the wave transmitted by one sensor is likely to interfere with the other and result in erratic operation.

In order to avoid this, it is necessary to adhere to the minimum distances between sensors.

Maximum tightening torque

Cylindrical sensors	Diameter mm	Tightening torque	Flat sensors	Screw	Tightening torque
XX0120	Ø 12	0.7 N.m	XX0F0	M3	0.7 N.m
XX080	Ø 18	1 N.m	XX0K0	M4	1 N.m
XX000	Ø 30	1.35 N.m	XX0V0	M3	0.7 N.m
XX0V30	-	1.35 N.m		Ø 18	1 N.m

Interchangeability

Interchangeability is made easy by using indexed fixing clamps:

- XSZ B112 (Ø 12 mm),
- XSZ B118 (Ø 18 mm),
- XSZ B130 (Ø 30 mm).

Cabling

Electrical connection

- **Connect the sensor before switching on the supply**

- **Length of cable**

No limitation up to 200 m or up to a line capacitance of $< 0.1 \mu$ F,

It is, however, advisable to take into account the voltage drop on the line.

- **Separation of control and power cables**

The sensors are immune to electrical interference encountered in normal industrial conditions. Where extreme conditions of electrical "noise" could occur (large motors, spot welders, etc.), it is advisable to protect against transients in the normal way:

- suppress interference at source,
- separate power and control wiring from each other,
- smooth the supply,
- limit the length of cable.

Setting-up precautions (continued)

Connection in series

This connection method is not recommended.

- Correct operation of the sensors cannot be assured and, if this method is used, tests must be made before installation. The following points should be taken into account:
 - Sensor 1 carries the load current in addition to the no-load current consumption values of the other sensors connected in series. For certain models, this connection method is not possible unless a current limiting resistor is used.
 - When in the closed state, each sensor will produce a voltage drop and, therefore, the load voltage should be selected accordingly.
 - As sensor 1 closes, sensor 2 will not operate until a certain time "T" has elapsed (corresponding to the first-up delay) and likewise for the following sensors in the sequence. "Flywheel" diodes should be used when the load being switched is inductive.

Sensors and units in series with an external mechanical contact

- The following points should be taken into account:
 - When the mechanical contact is open, the sensor is not supplied.
 - When the contact closes, the sensor will not operate until a certain time "T" has elapsed (corresponding to the first-up delay).

Connection in parallel

- No specific restrictions. The use of "flywheel" diodes is recommended when an inductive load (relay) is being switched.

Capacitive load (C > 0.1 mF)

- At switch-on, it is necessary to limit (by resistor) the charging current of the capacitive load C. The voltage drop in the sensor can also be taken into account by subtracting it from the supply voltage for calculation of R.

$$R = \frac{U \text{ (supply)}}{I \text{ max. (sensor)}}$$

Load comprising an incandescent lamp

- If the load comprises an incandescent lamp, the cold state resistance can be 10 times lower than the hot state resistance. This can cause very high current levels on switching. Fit a pre-heat resistance in parallel with the sensor.

$$R = \frac{U^2}{P} \times 10, \quad U = \text{supply voltage and } P = \text{lamp power}$$

Detection

Influencing factors

- The ultrasonic sensors are particularly suited for the detection of objects that are capable of reflecting an acoustic wave and, in general, having a flat surface perpendicular to the detection axis. However, the correct operation of the ultrasonic sensor can be disrupted by:
- air currents, which can accelerate or divert the acoustic wave transmitted by the sensor (ejection of part by air jet),
 - high temperature gradients within the detection zone: an object emitting considerable heat can create zones of varying temperature that will modify the propagation time of the wave and thus prevent reliable operation,
 - sound insulators: sound absorbing materials (cotton, fabrics, rubber, etc.),
 - the angle between the face of the object to be detected and the reference axis of the sensor: when the angle is offset from 90°, the wave is no longer reflected back along the sensor axis and the operating distance is reduced. The greater the distance between the sensor and the target, the greater the effect. Detection is not possible when the angle exceeds ± 10°.
 - the shape of the object to be detected: similar to the example above, an excessively angular object can be difficult to detect 1. In this case, use reflex mode detection.

Detection systems

- Diffuse mode
 - In this mode, it is the object itself that reflects the ultrasonic wave back to the sensor which, in turn, switches its output. It is the most widely used and the most simple mode.
- Reflex or beam break mode
 - The sensor is in a permanently detecting state on a fixed background of the machine and when the object to be detected breaks the acoustic beam the output switches state 2.
 - This mode is particularly recommended in cases where the shape of the object changes (irregular, angular, non perpendicular) and also for objects that absorb sound (see above).
 - Caution: In reflex mode, the NO function opens when an object is present and the NC function closes when an object is present (see "NO output/NC output according to the detection mode" table on page 27).
 - In cases where space is restricted, a reflector 3 and 4, angled at 45°, can be used. This system can be used for both the diffuse and reflex modes. This reflector can be a flat part of the machine or a separate element.
- Thru-beam mode
 - Detection is achieved using both a transmitter and receiver, with the transmitter permanently transmitting an acoustic wave to the receiver. The breaking of the beam by the presence of an object switches the output of the receiver. This mode provides long detection distances 5.
 - In this mode there is no blind zone.**

Storage temperature		°C - 40...+ 80	- 10...+ 80	
Operating temperature		°C - 20...+ 65	0...+ 50	
Vibration resistance		Conforming to IEC 60068-2-6	Amplitude ± 1 mm (f = 10...55 Hz)	
Mechanical shock resistance		Conforming to IEC 60068-2-27	30 gn, duration 11 ms, in all 3 axes	
Resistance to electromagnetic interference			Conforming to IEC 60947-5-2
